

e-TRIGGER

The e-trigger is an ideal solution to eliminate wiring to gate motors and doors and will save many hours digging trenches across driveways.

For example, you no longer need to wire an intercom (or another 3rd party device) directly into a gate motor. This unit connects to a wireless transceiver housed and connected to the gate motor.

When the gates have been triggered, the e-Trigger device creates a wireless bridge to the transceiver on the gate motor, activating the relay and opening the gates/door.

- The fully waterproof housing allows for external fitting with an easy-to-attach bracket provided.
- Power options include a 12-24VDC input or optional 3V CR2045 battery.
- Input is protected via an opto isolator.
- The easy-to-remove grommet will take a wire diameter of 4.4mm to 6mm
- Range up to 100 meters
- Frequency: 433.39 MHz

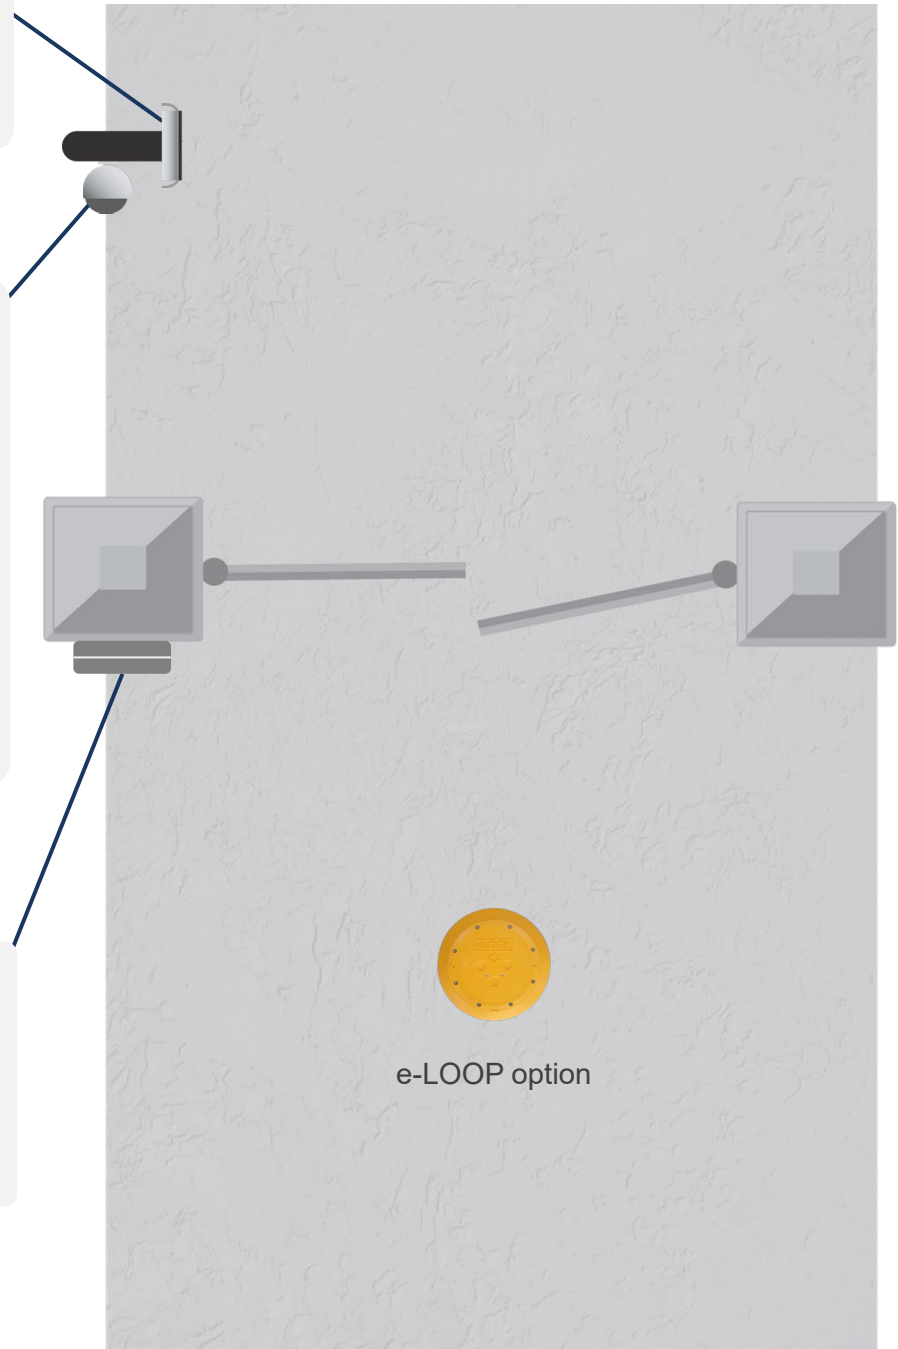

With the extensive aftermarket accessories supported by the e-TRIGGER, it's easy to seamlessly integrate systems such as cameras, microphones, keypads, buttons and Intercoms*.

The e-TRIGGER allows seamless installation of aftermarket accessories to be integrated within the e-TRANS system. The e-Trigger is used as a bridging system, between additional devices & the e-Trans system.

The e-TRIGGER is compatible with the e-LOOP's range of Transceivers.

*3rd party units sold separately.
